Motivation

- The Labor Insurance in Taiwan offers pension options of a lumpsum payment or a monthly pension.
- Should one choose lumpsum or monthly?
- Consider a retiree that
 - earns over 45,800 NTD a month,

Motivation

- The Labor Insurance in Taiwan offers pension options of a lumpsum payment or a monthly pension.
- Should one choose lumpsum or monthly?
- Consider a retiree that
 - earns over 45,800 NTD a month,
 - has worked for 30 years,

Motivation

- The Labor Insurance in Taiwan offers pension options of a lumpsum payment or a monthly pension.
- Should one choose lumpsum or monthly?
- Consider a retiree that
 - earns over 45,800 NTD a month,
 - has worked for 30 years,
 - retiring at 65,

Motivation

- The Labor Insurance in Taiwan offers pension options of a lumpsum payment or a monthly pension.
- Should one choose lumpsum or monthly?
- Consider a retiree that
 - earns over 45,800 NTD a month,
 - has worked for 30 years,
 - retiring at 65,
 - and lives 12 years after retirement.

Motivation

- The Labor Insurance in Taiwan offers pension options of a lumpsum payment or a monthly pension.
- Should one choose lumpsum or monthly?
- Consider a retiree that
 - earns over 45,800 NTD a month,
 - has worked for 30 years,
 - retiring at 65,
 - and lives 12 years after retirement.
- Lumpsum: 2,061,000 NTD.

Motivation

- The Labor Insurance in Taiwan offers pension options of a lumpsum payment or a monthly pension.
- Should one choose lumpsum or monthly?
- Consider a retiree that
 - earns over 45,800 NTD a month,
 - has worked for 30 years,
 - retiring at 65,
 - and lives 12 years after retirement.
- Lumpsum: 2,061,000 NTD.
- **Monthly: 2,724,504 NTD.** (2% annual rate)

Annuitization Puzzle

- Annuities insure against longevity risk.

Annuitization Puzzle

- Annuities insure against longevity risk.
- Low voluntary annuity purchases/participation.

Annuitization Puzzle

- Annuities insure against longevity risk.
- Low voluntary annuity purchases/participation.
- Why aren't annuities more popular?

Annuitization Puzzle

- Annuities insure against longevity risk.
- Low voluntary annuity purchases/participation.
- Why aren't annuities more popular?
 - Adverse selection and actuarially unfavorable prices.

Annuitization Puzzle

- Annuities insure against longevity risk.
- Low voluntary annuity purchases/participation.
- Why aren't annuities more popular?
 - Adverse selection and actuarially unfavorable prices.
 - Inflation risk and limited availability of indexed annuities.

Annuitization Puzzle

- Annuities insure against longevity risk.
- Low voluntary annuity purchases/participation.
- Why aren't annuities more popular?
 - Adverse selection and actuarially unfavorable prices.
 - Inflation risk and limited availability of indexed annuities.
 - Pre-existing annuities from public and defined-benefit pensions.

Annuitization Puzzle

- Annuities insure against longevity risk.
- Low voluntary annuity purchases/participation.
- Why aren't annuities more popular?
 - Adverse selection and actuarially unfavorable prices.
 - Inflation risk and limited availability of indexed annuities.
 - Pre-existing annuities from public and defined-benefit pensions.
 - Bequests.

Annuitization Puzzle

- Annuities insure against longevity risk.
- Low voluntary annuity purchases/participation.
- Why aren't annuities more popular?
 - Adverse selection and actuarially unfavorable prices.
 - Inflation risk and limited availability of indexed annuities.
 - Pre-existing annuities from public and defined-benefit pensions.
 - Bequests.
 - Medical-expense shocks and liquidity needs.

Annuitization Puzzle

- Annuities insure against longevity risk.

 - Exogenous provider-insolvency risk.

Annuitization Puzzle

- Annuities insure against longevity risk.
- Low voluntary annuity purchases/participation.
- Why aren't annuities more popular?
 - Adverse selection and actuarially unfavorable prices.
 - Inflation risk and limited availability of indexed annuities.
 - Pre-existing annuities from public and defined-benefit pensions.
 - Bequests.
 - Medical-expense shocks and liquidity needs.
 - Behavioral.
 - Exogenous provider-insolvency risk.
- **This paper:** Insolvency is endogenous—annuitization choices change the fund's liabilities and its probability of depletion.

How many people are choosing monthly?

► [View data explanation](#)

Model

Model Overview

- Continuous time and an infinite horizon.

Model Overview

- Continuous time and an infinite horizon.
- A continuum of workers chooses once, at retirement age T , between a lump-sum benefit ℓ and a monthly pension p .

Model Overview

- Continuous time and an infinite horizon.
- A continuum of workers chooses once, at retirement age T , between a lump-sum benefit ℓ and a monthly pension p .
- The pension fund earns a stochastic return and receives payroll tax revenue.

Model Overview

- Continuous time and an infinite horizon.
- A continuum of workers chooses once, at retirement age T , between a lump-sum benefit ℓ and a monthly pension p .
- The pension fund earns a stochastic return and receives payroll tax revenue.
- Benefits stop when the fund balance reaches zero.

Model Overview

- Continuous time and an infinite horizon.
- A continuum of workers chooses once, at retirement age T , between a lump-sum benefit ℓ and a monthly pension p .
- The pension fund earns a stochastic return and receives payroll tax revenue.
- Benefits stop when the fund balance reaches zero.
- Retirees' choices affect fund outflows and, consequently, the value of the monthly pension.

Population

- Let $g(t, s)$ denote the population density at age s :

$$\frac{\partial g}{\partial t}$$

Population

- Let $g(t, s)$ denote the population density at age s :

$$\frac{\partial g}{\partial t} = - \underbrace{\frac{\partial g}{\partial s}}_{\text{aging}}$$

Population

- Let $g(t, s)$ denote the population density at age s :

$$\frac{\partial g}{\partial t} = - \underbrace{\frac{\partial g}{\partial s}}_{\text{aging}} - \underbrace{m(s)g}_{\text{mortality}}$$

Population

- Let $g(t, s)$ denote the population density at age s :

$$\frac{\partial g}{\partial t} = - \underbrace{\frac{\partial g}{\partial s}}_{\text{aging}} - \underbrace{m(s)g}_{\text{mortality}}, \quad g(t, 0) = \underbrace{\int b(s)g(t, s) ds}_{\text{birth}}.$$

Population

- Let $g(t, s)$ denote the population density at age s :

$$\frac{\partial g}{\partial t} = - \underbrace{\frac{\partial g}{\partial s}}_{\text{aging}} - \underbrace{m(s)g}_{\text{mortality}}, \quad g(t, 0) = \underbrace{\int b(s)g(t, s) ds}_{\text{birth}}.$$

- Assumptions:

Population

- Let $g(t, s)$ denote the population density at age s :

$$\frac{\partial g}{\partial t} = - \underbrace{\frac{\partial g}{\partial s}}_{\text{aging}} - \underbrace{m(s)g}_{\text{mortality}}, \quad g(t, 0) = \underbrace{\int b(s)g(t, s) ds}_{\text{birth}}.$$

- Assumptions:
 - Constant fertility rate.

Population

- Let $g(t, s)$ denote the population density at age s :

$$\frac{\partial g}{\partial t} = - \underbrace{\frac{\partial g}{\partial s}}_{\text{aging}} - \underbrace{m(s)g}_{\text{mortality}}, \quad g(t, 0) = \underbrace{\int b(s)g(t, s) ds}_{\text{birth}}.$$

- Assumptions:
 - Constant fertility rate.
 - Exposes to constant mortality rate only after $T_m \leq T$.

Population

- Let $g(t, s)$ denote the population density at age s :

$$\frac{\partial g}{\partial t} = - \underbrace{\frac{\partial g}{\partial s}}_{\text{aging}} - \underbrace{m(s)g}_{\text{mortality}}, \quad g(t, 0) = \underbrace{\int b(s)g(t, s) ds}_{\text{birth}}.$$

- Assumptions:
 - Constant fertility rate.
 - Exposes to constant mortality rate only after $T_m \leq T$.
 - Stable normalized population density.

Population

- Let $g(t, s)$ denote the population density at age s :

$$\frac{\partial g}{\partial t} = - \underbrace{\frac{\partial g}{\partial s}}_{\text{aging}} - \underbrace{m(s)g}_{\text{mortality}}, \quad g(t, 0) = \underbrace{\int b(s)g(t, s) ds}_{\text{birth}}.$$

- Assumptions:
 - Constant fertility rate.
 - Exposes to constant mortality rate only after $T_m \leq T$.
 - Stable normalized population density.
- In steady state, normalized population density $\hat{g} = g/N_t$, $N_t = \int g(t, s)ds$ satisfies

$$\hat{g}(s) = \begin{cases} be^{-ns}, & s < T_m, \\ be^{-ns}e^{-m(s-T_m)}, & s \geq T_m, \end{cases}$$

where $dN_t = nN_t dt$ is the population growth rate.

Retiree Pension Choice

- A retiring individual chooses between lumpsum and monthly to maximize

$$u_{it}(d) = \left\{ \begin{array}{l} \end{array} \right.$$

Retiree Pension Choice

- A retiring individual chooses between lumpsum and monthly to maximize

$$u_{it}(d) = \begin{cases} \alpha + \log(\underbrace{\ell}_{\text{lumpsum}}) + \epsilon_i(\ell), & d = \text{lumpsum}, \\ \end{cases}$$

Retiree Pension Choice

- A retiring individual chooses between lumpsum and monthly to maximize

$$u_{it}(d) = \begin{cases} \alpha + \log(\underbrace{\ell}_{\text{lumpsum}}) + \epsilon_i(\ell), & d = \text{lumpsum}, \\ \log(\underbrace{V(\hat{B}_t, \hat{Q}_t)}_{\text{PDV of monthly}}) + \epsilon_i(p), & d = \text{pension}. \end{cases}$$

Retiree Pension Choice

- A retiring individual chooses between lumpsum and monthly to maximize

$$u_{it}(d) = \begin{cases} \alpha + \log(\underbrace{\ell}_{\text{lumpsum}}) + \epsilon_i(\ell), & d = \text{lumpsum}, \\ \log(\underbrace{V(\hat{B}_t, \hat{Q}_t)}_{\text{PDV of monthly}}) + \epsilon_i(p), & d = \text{pension}. \end{cases}$$

- The PDV of monthly is

$$V(\hat{B}, \hat{Q}) = \mathbb{E} \left[\int_0^{T_{\hat{B}}} e^{-(\rho+m)s} \underbrace{p}_{\text{monthly benefit}} ds \mid \hat{B}, \hat{Q} \right]$$

where $T_{\hat{B}}$ is the bankruptcy time.

Pension System

- Monthly recipients Q_t :

$$dQ_t = [\quad] dt.$$

Pension System

- Monthly recipients Q_t :

$$dQ_t = \left[\underbrace{q_t \hat{g}(T) N_t}_{\text{new retirees}} \right] dt.$$

Pension System

- Monthly recipients Q_t :

$$dQ_t = \left[\underbrace{q_t \hat{g}(T) N_t}_{\text{new retirees}} - \underbrace{m Q_t}_{\text{mortality}} \right] dt.$$

Pension System

- Monthly recipients Q_t :

$$dQ_t = \left[\underbrace{q_t \hat{g}(T) N_t}_{\text{new retirees}} - \underbrace{m Q_t}_{\text{mortality}} \right] dt.$$

- q_t : share of monthly among new retirees.

Pension System

- Monthly recipients Q_t :

$$dQ_t = \left[\underbrace{q_t \hat{g}(T) N_t}_{\text{new retirees}} - \underbrace{m Q_t}_{\text{mortality}} \right] dt.$$

- q_t : share of monthly among new retirees.
- Fund balance B_t :

$$dB_t = \left[\phantom{\frac{r}{2} B_t} \right] dt \quad .$$

Pension System

- Monthly recipients Q_t :

$$dQ_t = \left[\underbrace{q_t \hat{g}(T) N_t}_{\text{new retirees}} - \underbrace{m Q_t}_{\text{mortality}} \right] dt.$$

- q_t : share of monthly among new retirees.
- Fund balance B_t :

$$dB_t = \left[\underbrace{r B_t}_{\text{return}} \right] dt .$$

Pension System

- Monthly recipients Q_t :

$$dQ_t = \left[\underbrace{q_t \hat{g}(T) N_t}_{\text{new retirees}} - \underbrace{m Q_t}_{\text{mortality}} \right] dt.$$

- q_t : share of monthly among new retirees.
- Fund balance B_t :

$$dB_t = \left[\underbrace{r B_t}_{\text{return}} + \underbrace{\tau y N_t \int_{T_w}^T \hat{g}(s) ds}_{\text{pension tax}} \right] dt .$$

Pension System

- Monthly recipients Q_t :

$$dQ_t = \left[\underbrace{q_t \hat{g}(T) N_t}_{\text{new retirees}} - \underbrace{m Q_t}_{\text{mortality}} \right] dt.$$

- q_t : share of monthly among new retirees.
- Fund balance B_t :

$$dB_t = \left[\underbrace{r B_t}_{\text{return}} + \underbrace{\tau y N_t \int_{T_w}^T \hat{g}(s) ds}_{\text{pension tax}} - \underbrace{\ell(1 - q_t) N_t \hat{g}(T)}_{\text{lump sum}} \right] dt.$$

Pension System

- Monthly recipients Q_t :

$$dQ_t = \left[\underbrace{q_t \hat{g}(T) N_t}_{\text{new retirees}} - \underbrace{m Q_t}_{\text{mortality}} \right] dt.$$

- q_t : share of monthly among new retirees.
- Fund balance B_t :

$$dB_t = \left[\underbrace{r B_t}_{\text{return}} + \underbrace{\tau y N_t \int_{T_w}^T \hat{g}(s) ds}_{\text{pension tax}} - \underbrace{\ell(1 - q_t) N_t \hat{g}(T)}_{\text{lump sum}} - \underbrace{p Q_t}_{\text{monthly}} \right] dt .$$

Pension System

- Monthly recipients Q_t :

$$dQ_t = \left[\underbrace{q_t \hat{g}(T) N_t}_{\text{new retirees}} - \underbrace{m Q_t}_{\text{mortality}} \right] dt.$$

- q_t : share of monthly among new retirees.
- Fund balance B_t :

$$dB_t = \left[\underbrace{r B_t}_{\text{return}} + \underbrace{\tau y N_t \int_{T_w}^T \hat{g}(s) ds}_{\text{pension tax}} - \underbrace{\ell(1 - q_t) N_t \hat{g}(T)}_{\text{lump sum}} - \underbrace{p Q_t}_{\text{monthly}} \right] dt + \underbrace{\sigma B_t dZ_t}_{\text{stochastic}}.$$

Detrended State Dynamics

- Define per capita states $\hat{B}_t = B_t/N_t$ and $\hat{Q}_t = Q_t/N_t$.

$$d\hat{B}_t = \left[\underbrace{(r - n)\hat{B}_t}_{\text{net return}} + \underbrace{\tau y \int_{T_w}^T \hat{g}(s) ds}_{\text{pension tax}} - \underbrace{\ell(1 - q_t)\hat{g}(T)}_{\text{lump sum}} - \underbrace{p\hat{Q}_t}_{\text{monthly}} \right] dt + \underbrace{\sigma\hat{B}_t dZ_t}_{\text{stochastic}},$$
$$d\hat{Q}_t = \left[\underbrace{q_t\hat{g}(T)}_{\text{new retirees}} - \underbrace{(m + n)\hat{Q}_t}_{\text{mortality}} \right] dt.$$

Detrended State Dynamics

- Define per capita states $\hat{B}_t = B_t/N_t$ and $\hat{Q}_t = Q_t/N_t$.

$$d\hat{B}_t = \left[\underbrace{(r - n)\hat{B}_t}_{\text{net return}} + \underbrace{\tau y \int_{T_w}^T \hat{g}(s) ds}_{\text{pension tax}} - \underbrace{\ell(1 - q_t)\hat{g}(T)}_{\text{lump sum}} - \underbrace{p\hat{Q}_t}_{\text{monthly}} \right] dt + \underbrace{\sigma \hat{B}_t dZ_t}_{\text{stochastic}},$$
$$d\hat{Q}_t = \left[\underbrace{q_t \hat{g}(T)}_{\text{new retirees}} - \underbrace{(m + n)\hat{Q}_t}_{\text{mortality}} \right] dt.$$

- More lump-sum claims reduce the fund immediately.

Detrended State Dynamics

- Define per capita states $\hat{B}_t = B_t/N_t$ and $\hat{Q}_t = Q_t/N_t$.

$$d\hat{B}_t = \left[\underbrace{(r - n)\hat{B}_t}_{\text{net return}} + \underbrace{\tau y \int_{T_w}^T \hat{g}(s) ds}_{\text{pension tax}} - \underbrace{\ell(1 - q_t)\hat{g}(T)}_{\text{lump sum}} - \underbrace{p\hat{Q}_t}_{\text{monthly}} \right] dt + \underbrace{\sigma \hat{B}_t dZ_t}_{\text{stochastic}},$$
$$d\hat{Q}_t = \left[\underbrace{q_t \hat{g}(T)}_{\text{new retirees}} - \underbrace{(m + n)\hat{Q}_t}_{\text{mortality}} \right] dt.$$

- More lump-sum claims reduce the fund immediately.
- More monthly claims raise future liabilities through $\hat{Q}_t$.

Aggregation and Equilibrium

- Assume the idiosyncratic preference $\epsilon_{it}(d) \sim \text{Gumbel}(0, 1)$.

$$q_t = q(\hat{B}_t, \hat{Q}_t) = \frac{1}{1 + \exp \left(\alpha + \log(\underbrace{\ell}_{\text{lumpsum}}) - \log(\underbrace{V(\hat{B}_t, \hat{Q}_t)}_{\text{PDV of monthly}}) \right)}$$

Aggregation and Equilibrium

- Assume the idiosyncratic preference $\epsilon_{it}(d) \sim \text{Gumbel}(0, 1)$.

$$q_t = q(\hat{B}_t, \hat{Q}_t) = \frac{1}{1 + \exp(\alpha + \underbrace{\log(\ell)}_{\text{lumpsum}} - \log(\underbrace{V(\hat{B}_t, \hat{Q}_t)}_{\text{PDV of monthly}}))}$$

- In equilibrium:

Aggregation and Equilibrium

- Assume the idiosyncratic preference $\epsilon_{it}(d) \sim \text{Gumbel}(0, 1)$.

$$q_t = q(\hat{B}_t, \hat{Q}_t) = \frac{1}{1 + \exp \left(\alpha + \underbrace{\log(\ell)}_{\text{lumpsum}} - \log(\underbrace{V(\hat{B}_t, \hat{Q}_t)}_{\text{PDV of monthly}}) \right)}$$

- In equilibrium:
 - Given belief on $T_{\hat{B}}$, new retirees choose between lumpsum and monthly optimally.

Aggregation and Equilibrium

- Assume the idiosyncratic preference $\epsilon_{it}(d) \sim \text{Gumbel}(0, 1)$.

$$q_t = q(\hat{B}_t, \hat{Q}_t) = \frac{1}{1 + \exp \left(\alpha + \underbrace{\log(\ell)}_{\text{lumpsum}} - \log(\underbrace{V(\hat{B}_t, \hat{Q}_t)}_{\text{PDV of monthly}}) \right)}$$

- In equilibrium:
 - Given belief on $T_{\hat{B}}$, new retirees choose between lumpsum and monthly optimally.
 - Individuals optimizing aggregates up to q_t .

Aggregation and Equilibrium

- Assume the idiosyncratic preference $\epsilon_{it}(d) \sim \text{Gumbel}(0, 1)$.

$$q_t = q(\hat{B}_t, \hat{Q}_t) = \frac{1}{1 + \exp \left(\alpha + \underbrace{\log(\ell)}_{\text{lumpsum}} - \log(\underbrace{V(\hat{B}_t, \hat{Q}_t)}_{\text{PDV of monthly}}) \right)}$$

- In equilibrium:
 - Given belief on $T_{\hat{B}}$, new retirees choose between lumpsum and monthly optimally.
 - Individuals optimizing aggregates up to q_t .
 - q_t implies the state dynamics consistent with the belief on $T_{\hat{B}}$.

Value Function and Numerical Solution

- The PDV of monthly solves the nonlinear HJB equation

$$(\rho + m)V(\hat{B}, \hat{Q}) =$$

Value Function and Numerical Solution

- The PDV of monthly solves the nonlinear HJB equation

$$(\rho + m)V(\hat{B}, \hat{Q}) = \underbrace{p}_{\text{monthly benefit}}$$

Value Function and Numerical Solution

- The PDV of monthly solves the nonlinear HJB equation

$$\begin{aligned} (\rho + m)V(\hat{B}, \hat{Q}) = & \underbrace{p}_{\text{monthly benefit}} \\ & + \underbrace{\left[(r - n)\hat{B}_t + \tau y \int_{T_w}^T \hat{g}(s) ds - \ell(1 - q_t)\hat{g}(T) - p\hat{Q}_t \right]}_{\text{drift of } \hat{B}} \frac{\partial V}{\partial \hat{B}} \end{aligned}$$

Value Function and Numerical Solution

- The PDV of monthly solves the nonlinear HJB equation

$$\begin{aligned}(\rho + m)V(\hat{B}, \hat{Q}) = & \underbrace{p}_{\text{monthly benefit}} \\ & + \underbrace{\left[(r - n)\hat{B}_t + \tau y \int_{T_w}^T \hat{g}(s) ds - \ell(1 - q_t)\hat{g}(T) - p\hat{Q}_t \right]}_{\text{drift of } \hat{B}} \frac{\partial V}{\partial \hat{B}} \\ & + \underbrace{\left[q_t\hat{g}(T) - (m + n)\hat{Q}_t \right]}_{\text{drift of } \hat{Q}} \frac{\partial V}{\partial \hat{Q}}\end{aligned}$$

Value Function and Numerical Solution

- The PDV of monthly solves the nonlinear HJB equation

$$\begin{aligned}
 (\rho + m)V(\hat{B}, \hat{Q}) = & \underbrace{p}_{\text{monthly benefit}} \\
 & + \underbrace{\left[(r - n)\hat{B}_t + \tau y \int_{T_w}^T \hat{g}(s) ds - \ell(1 - q_t)\hat{g}(T) - p\hat{Q}_t \right]}_{\text{drift of } \hat{B}} \frac{\partial V}{\partial \hat{B}} \\
 & + \underbrace{\left[q_t\hat{g}(T) - (m + n)\hat{Q}_t \right]}_{\text{drift of } \hat{Q}} \frac{\partial V}{\partial \hat{Q}} + \frac{1}{2} \left(\underbrace{\sigma \hat{B}_t}_{\text{diffusion of } \hat{B}} \right)^2 \frac{\partial^2 V}{\partial \hat{B}^2}
 \end{aligned}$$

Value Function and Numerical Solution

- The PDV of monthly solves the nonlinear HJB equation

$$\begin{aligned}
 (\rho + m)V(\hat{B}, \hat{Q}) = & \underbrace{p}_{\text{monthly benefit}} \\
 & + \underbrace{\left[(r - n)\hat{B}_t + \tau y \int_{T_w}^T \hat{g}(s) ds - \ell(1 - q_t)\hat{g}(T) - p\hat{Q}_t \right]}_{\text{drift of } \hat{B}} \frac{\partial V}{\partial \hat{B}} \\
 & + \underbrace{\left[q_t \hat{g}(T) - (m + n)\hat{Q}_t \right]}_{\text{drift of } \hat{Q}} \frac{\partial V}{\partial \hat{Q}} + \frac{1}{2} \left(\underbrace{\sigma \hat{B}_t}_{\text{diffusion of } \hat{B}} \right)^2 \frac{\partial^2 V}{\partial \hat{B}^2}
 \end{aligned}$$

- Boundary condition: $V(0, \hat{Q}) = 0$.

Value Function and Numerical Solution

- The PDV of monthly solves the nonlinear HJB equation

$$\begin{aligned}
 (\rho + m)V(\hat{B}, \hat{Q}) = & \underbrace{p}_{\text{monthly benefit}} \\
 & + \underbrace{\left[(r - n)\hat{B}_t + \tau y \int_{T_w}^T \hat{g}(s) ds - \ell(1 - q_t)\hat{g}(T) - p\hat{Q}_t \right]}_{\text{drift of } \hat{B}} \frac{\partial V}{\partial \hat{B}} \\
 & + \underbrace{\left[q_t \hat{g}(T) - (m + n)\hat{Q}_t \right]}_{\text{drift of } \hat{Q}} \frac{\partial V}{\partial \hat{Q}} + \frac{1}{2} \left(\underbrace{\sigma \hat{B}_t}_{\text{diffusion of } \hat{B}} \right)^2 \frac{\partial^2 V}{\partial \hat{B}^2}
 \end{aligned}$$

- Boundary condition: $V(0, \hat{Q}) = 0$.
- At a sufficiently large upper boundary, impose $\partial V / \partial \hat{B} \approx 0$.

Value Function and Numerical Solution

- The PDV of monthly solves the nonlinear HJB equation

$$\begin{aligned}
 (\rho + m)V(\hat{B}, \hat{Q}) = & \underbrace{p}_{\text{monthly benefit}} \\
 & + \underbrace{\left[(r - n)\hat{B}_t + \tau y \int_{T_w}^T \hat{g}(s) ds - \ell(1 - q_t)\hat{g}(T) - p\hat{Q}_t \right]}_{\text{drift of } \hat{B}} \frac{\partial V}{\partial \hat{B}} \\
 & + \underbrace{\left[q_t \hat{g}(T) - (m + n)\hat{Q}_t \right]}_{\text{drift of } \hat{Q}} \frac{\partial V}{\partial \hat{Q}} + \frac{1}{2} \left(\underbrace{\sigma \hat{B}_t}_{\text{diffusion of } \hat{B}} \right)^2 \frac{\partial^2 V}{\partial \hat{B}^2}
 \end{aligned}$$

- Boundary condition: $V(0, \hat{Q}) = 0$.
- At a sufficiently large upper boundary, impose $\partial V / \partial \hat{B} \approx 0$.
- Solve by finite differences and successive iteration, equivalent to semi-implicit scheme with $dt = \infty$. [View algorithm](#)

- Low pension tax rate:
 - Weak fundamental
 - Bankruptcy time ↓
 - Fraction of monthly ↓
 - Bankruptcy time ↓.
- Medium pension tax rate:
 - Stronger fundamental
 - Bankruptcy time ↑
 - Fraction of monthly ↑

Wrap up

- Low pension tax rate:
 - Weak fundamental
 - Bankruptcy time ↓
 - Fraction of monthly ↓
 - Bankruptcy time ↓.
- Medium pension tax rate:
 - Stronger fundamental
 - Bankruptcy time ↑
 - Fraction of monthly ↑
 - Fund level ↑ + Monthly recipients ↑

Wrap up

- Low pension tax rate:
 - Weak fundamental
 - Bankruptcy time ↓
 - Fraction of monthly ↓
 - Bankruptcy time ↓.
- Medium pension tax rate:
 - Stronger fundamental
 - Bankruptcy time ↑
 - Fraction of monthly ↑
 - Fund level ↑ + Monthly recipients ↑
 - When too many monthly recipients, fund level ↓↓

Wrap up

- Low pension tax rate:
 - Weak fundamental
 - Bankruptcy time ↓
 - Fraction of monthly ↓
 - Bankruptcy time ↓.
- Medium pension tax rate:
 - Stronger fundamental
 - Bankruptcy time ↑
 - Fraction of monthly ↑
 - Fund level ↑ + Monthly recipients ↑
 - When too many monthly recipients, fund level ↓↓
 - Fraction of monthly ↓ + Many monthly recipients

Wrap up

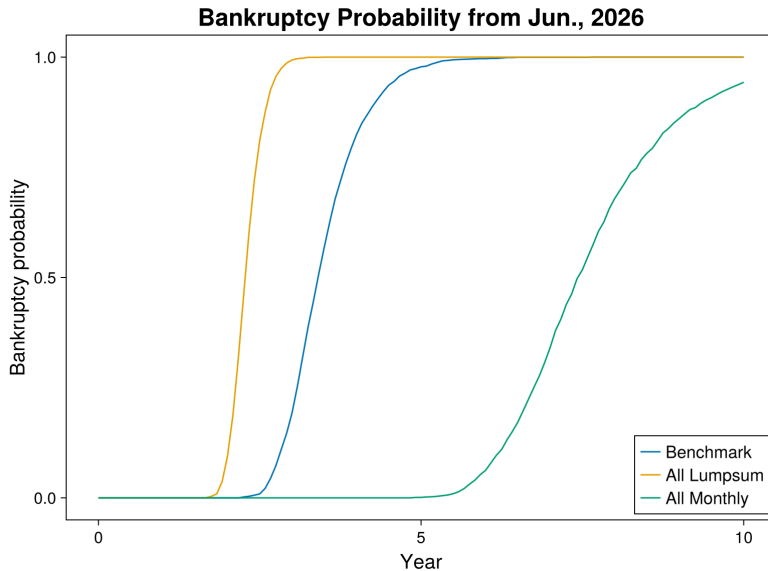

- Low pension tax rate:
 - Weak fundamental
 - Bankruptcy time ↓
 - Fraction of monthly ↓
 - Bankruptcy time ↓.
- Medium pension tax rate:
 - Stronger fundamental
 - Bankruptcy time ↑
 - Fraction of monthly ↑
 - Fund level ↑ + Monthly recipients ↑
 - When too many monthly recipients, fund level ↓↓
 - Fraction of monthly ↓ + Many monthly recipients
 - Bankruptcy time ↓↓.

- Experiments simulated from June 2026.
 - No monthly option or lumpsum option ($\alpha \rightarrow \pm\infty$).

- Experiments simulated from June 2026.
 - No monthly option or lumpsum option ($\alpha \rightarrow \pm\infty$).
 - Raise pension tax rate.

- Experiments simulated from June 2026.
 - No monthly option or lumpsum option ($\alpha \rightarrow \pm\infty$).
 - Raise pension tax rate.
 - Cut benefits.

Bankruptcy Probabilities

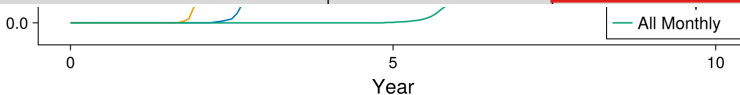

Bankruptcy Probabilities

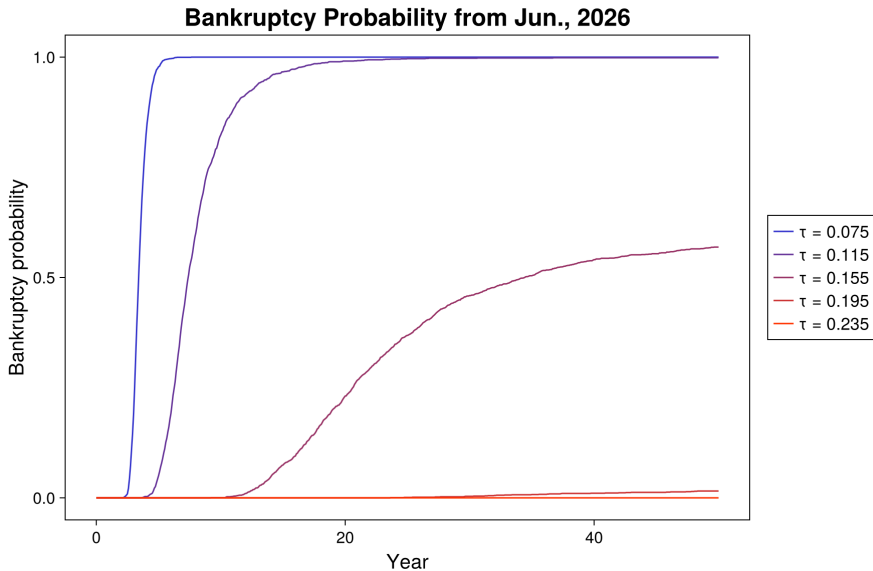

Bankruptcy Probability from Jun., 2026

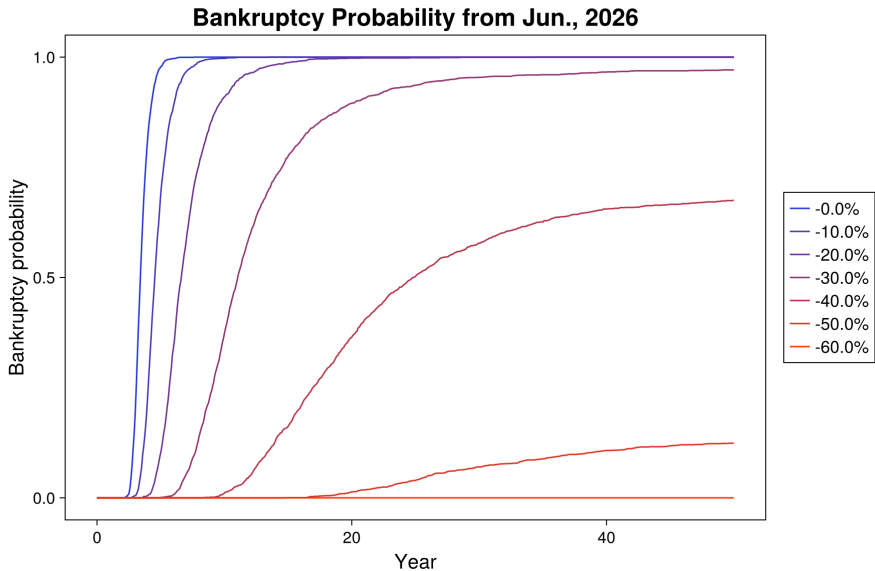

財務狀況	前次精算 109/12/31	本次精算 112/12/31
攤提過去未提存負債之平衡費率	27.83%	31.42%
不攤提過去未提存負債之平衡費率	16.27%	17.19%
精算負債 AL	11 兆 501 億元	14 兆 1,027 億元
勞保基金結餘 Fund	7,625 億元	8,729 億元
未提存精算負債 UAL = AL - Fund	10 兆 2,876 億元	13 兆 2,298 億元
已提存基金比率 = Fund / AL	6.90%	6.19%
保費收入不足支出年度	106 年	106 年
基金累積餘額出現負值年度	117 年	120 年

Bankruptcy Probabilities for Different τ

Bankruptcy Probabilities for Cutting Benefits

Conclusions

- Take away:

Conclusions

- Take away:
 - Early recipients are incentivized to take monthly, building up the fragility.

Conclusions

- Take away:
 - Early recipients are incentivized to take monthly, building up the fragility.
 - Lumpsum option accelerates the bankruptcy.

- Take away:
 - Early recipients are incentivized to take monthly, building up the fragility.
 - Lumpsum option accelerates the bankruptcy.
 - Raising tax rate to 23.5% or cutting benefits by 60% reduces the bankruptcy probabilities within 50 years near 0.

Conclusions

- Take away:
 - Early recipients are incentivized to take monthly, building up the fragility.
 - Lumpsum option accelerates the bankruptcy.
 - Raising tax rate to 23.5% or cutting benefits by 60% reduces the bankruptcy probabilities within 50 years near 0.
- To do:

Conclusions

- Take away:
 - Early recipients are incentivized to take monthly, building up the fragility.
 - Lumpsum option accelerates the bankruptcy.
 - Raising tax rate to 23.5% or cutting benefits by 60% reduces the bankruptcy probabilities within 50 years near 0.
- To do:
 - Relax the mortality assumption.

Conclusions

- Take away:
 - Early recipients are incentivized to take monthly, building up the fragility.
 - Lumpsum option accelerates the bankruptcy.
 - Raising tax rate to 23.5% or cutting benefits by 60% reduces the bankruptcy probabilities within 50 years near 0.
- To do:
 - Relax the mortality assumption.
 - Belief on government's reform attitude.

Conclusions

- Take away:
 - Early recipients are incentivized to take monthly, building up the fragility.
 - Lumpsum option accelerates the bankruptcy.
 - Raising tax rate to 23.5% or cutting benefits by 60% reduces the bankruptcy probabilities within 50 years near 0.
- To do:
 - Relax the mortality assumption.
 - Belief on government's reform attitude.
 - Endogenous retirement.

Conclusions

- Take away:
 - Early recipients are incentivized to take monthly, building up the fragility.
 - Lumpsum option accelerates the bankruptcy.
 - Raising tax rate to 23.5% or cutting benefits by 60% reduces the bankruptcy probabilities within 50 years near 0.
- To do:
 - Relax the mortality assumption.
 - Belief on government's reform attitude.
 - Endogenous retirement.
 - Boom period in return.

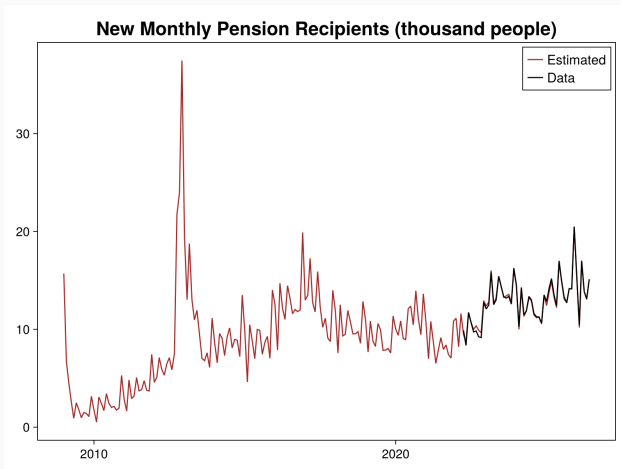

Appendix

- **Official monthly sources (since 2009):**
 - Bureau of Labor Funds: fund balance and investment return.
 - Bureau of Labor Insurance: stocks of monthly recipients and new lump-sum claims.
 - Ministry of the Interior: population and mortality at ages 60+.
- BLI reports new monthly recipients (first payments) only from May 2022. Before then, reconstruct entries from the stock of monthly recipients:

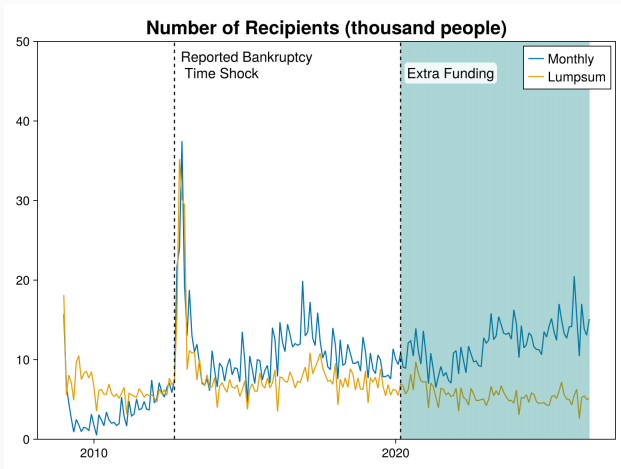

new monthly recipients = change in the recipient stock + estimated deaths
+ average correction from the overlap period.

Estimated deaths use the monthly mortality rate implied by annual mortality among Taiwan residents aged 60+; negative estimates are set to zero.

Successive Iteration Algorithm

Require: Initial guess $V^{(0)}$, tolerance $\epsilon > 0$, maximum iterations K

1: Set $k \leftarrow 0$

2: **repeat**

3: Given $V^{(k)}$, compute

$$\mu_B^{(k)} = \mu_B(B, Q, V^{(k)}(B, Q)), \quad \mu_Q^{(k)} = \mu_Q(B, Q, V^{(k)}(B, Q))$$

and the infinitesimal generator

$$\mathcal{A}^{(k)} = \mu_B^{(k)} \frac{\partial}{\partial B} + \mu_Q^{(k)} \frac{\partial}{\partial Q} + \frac{1}{2} \sigma^2 B^2 \frac{\partial^2}{\partial B^2}.$$

with adjustments to the boundary nodes.

4: Solve the linear system

$$\left((\rho + m)I - \mathcal{A}^{(k)} \right) V^{(k+1)} = \mathbf{b}, \quad \mathbf{b} = \rho \text{vec} \begin{pmatrix} 0 & 0 & \cdots & 0 \\ 1 & 1 & \cdots & 1 \\ \vdots & \ddots & \ddots & \vdots \\ 1 & \cdots & 1 & 1 \end{pmatrix}.$$

5: Compute the error

$$e^{(k+1)} \leftarrow \left\| V^{(k+1)} - V^{(k)} \right\|_{\infty}.$$

6: $k \leftarrow k + 1$

7: **until** $e^{(k)} < \epsilon$ or $k = K$

8: **return** $V^{(k)}$.
